

CRMCONNECT

Mindbody to Klaviyo, built for **100+ locations** and every one you open next.

CRMConnect is APIANT's turnkey Mindbody to Klaviyo integration. This proposal for SweatHouz covers the data it syncs, how locations are added as the brand grows, and pricing at 100+ sites.

"APIANT has been instrumental in integrating Mindbody with our data factory across more than 200 locations within our franchise system... I highly recommend APIANT for their professionalism, speed, and technical expertise."

Brad Bundy, COO, The Exercise Coach | 200+ location Mindbody franchise

EXECUTIVE SUMMARY

The proposal in brief

Following our conversation with VMO Media, this proposal covers the three things that matter for a decision: proof of exactly what the data looks like inside Klaviyo, a plan for onboarding 100+ locations with the existing Klaviyo work protected as far as possible, and pricing that works at SweatHouz's scale. It is built on CRMConnect, APIANT's turnkey Mindbody to Klaviyo integration.

What changes as locations are added. The native integration carries every site ID in one connection, so each new studio means going back into the connection all 100+ existing studios depend on. CRMConnect deploys each studio independently, so opening the next location is a routine step rather than a change to the live setup.

The cost is \$50 per location per month, flat. No contact-volume pricing (1M+ contacts cost nothing extra), no per-site surprises, and the rate is locked as the brand grows past 150 or 200 locations. Onboarding is \$50 per location, one time, all 106 sites included: \$5,300 to onboard the entire fleet, against a \$54,000 list price.

A 30-day window to change your mind. The commitment is annual, but for 30 days after launch SweatHouz can decide it is not the right fit and be released from the contract. In that case APIANT works with the team to revert to the previous setup in an orderly way. Through setup itself, the native integration stays on until our sync is verified to deliver everything it provided, so the current setup keeps running while the new one is proven.

THE CORE OF IT

Three questions that run 70 to 80% of retention

Strip away the field mappings and lifecycle marketing for an appointments business comes down to three questions about every contact, answered reliably and immediately inside Klaviyo:

- **When did they last buy something, and what was it?** Intro session, 3-pack, membership tier. Purchase recency and product drive every conversion flow.
- **When did they last actually come in?** Not booked. Attended. A member who booked three sessions and showed up to none is a churn risk wearing a healthy-looking booking history.
- **When are they scheduled to come in next?** The hardest question technically and the most valuable. It requires re-checking the client's full upcoming schedule every time an appointment completes, changes, or cancels. CRMConnect does exactly that, within seconds of the event, and keeps the answer on the profile where segments and flows can use it.

With these three answers current on every profile, SweatHouz can automate the large majority of conversion and retention: booking reminders, first-visit follow-up, intro-to-member conversion, cancel-save windows, win-backs. Everything segments per location. The screenshots that follow show it running live in Klaviyo.

What the native integration covers, and what CRMConnect adds

The native Mindbody to Klaviyo integration does its job well: it is included with Klaviyo, it syncs a solid baseline of client data, and at connection it backfills client profiles from the previous two years. This section covers what changes as SweatHouz keeps opening locations, and what a purpose-built integration adds on top.

1. Adding a location

The native connection carries its site IDs as one configured list, so growing that list means going back into the connection all 100+ existing studios depend on. CRMConnect deploys each studio as its own isolated integration: adding site 107 does not touch the other 106.

2. Event history for a new site

Klaviyo's documentation notes that no event data is synced historically, so a newly connected studio begins with client profiles but no purchase or visit history behind them. CRMConnect replays historical sales and visits as real Klaviyo events, which is what Klaviyo's predictive analytics (CLV, churn risk) draw on.

3. Cancellations and lifecycle changes

Native emits a Cancelled Class event, so class cancellations do trigger flows. It does not emit an appointment cancellation, a membership cancellation, or a contract cancellation. For an appointments-only brand like SweatHouz, that means the cancellations that actually happen are the ones that stay invisible. CRMConnect emits all four, which is what makes save-and-rebook journeys possible.

4. Forward-looking data

Native records a booking as an event when it happens, and that event is never revised: if the client reschedules, cancels, or attends, nothing updates. There is no next-appointment field on the profile, so "who is coming in this week" is not something the profile can be segmented on. CRMConnect maintains a live "next scheduled visit" on every profile and recomputes it within seconds of any booking, change, cancellation, or attendance. That field is what reminder, no-show, and lapse flows key on.

STATED PLAINLY

Everything native provides today is preserved: CRMConnect writes the same client properties, syncs email consent the same way, and adds the capabilities above. Nothing SweatHouz relies on today is given up in the move.

CAPABILITY	NATIVE INTEGRATION	APIANT CRMCONNECT
Profile properties synced	15	69+
Event types	11	15, incl. canonical revenue events
Client profile backfill	2 years, automatic (profiles only)	Any window agreed at onboarding
Historical event backfill	Not included	Sales and visits replayed as events
Cancellation events	Class only	Appointment, class, membership, contract
Next scheduled visit on profile	No such property	Recomputed within seconds of any change
Adding location #107	Update the shared connection	Isolated deploy, others untouched

One client, one profile, full history

These are unretouched screenshots from a live CRMConnect integration syncing a Mindbody test studio into Klaviyo. Same account structure SweatHouz runs: many sites, one Klaviyo account.

The screenshot displays the Klaviyo CRM interface for a client profile named Joan Maverick. The interface is divided into three main sections: Channel consent, Custom properties, and All events.

Channel consent: This section shows three items, all marked as "Never subscribed":

- Email (Never subscribed)
- Text messaging marketing (Never subscribed)
- Text messaging transactional (Never subscribed)

Custom properties: This section displays a table of custom properties for the client:

Key	Value
\$phone_number_region	US
Birthday	2026-02-01T05:00:00
MB Account balance	0.0
MB Client ID	100002330

All events: This section shows a timeline of events for the client:

- MB Appointment Booked (Jul 12, 2026, 10:51 PM EDT)
- MB Appointment Cancelled (Jul 12, 2026, 10:40 PM EDT)
- Ordered Product (Jul 12, 2026, 10:57 AM EDT)
- Placed order for "\$26.49" (Jul 12, 2026, 10:57 AM EDT)
- Placed order for "\$26.49" (Jul 12, 2026, 10:57 AM EDT)
- Ordered "AquaGlow Hydration Mist" (Jul 12, 2026, 10:57 AM EDT)

The interface also includes a sidebar with navigation options, a search bar, and buttons for "View messages" and "Profile actions".

The client profile. Left: Mindbody data as Klaviyo custom properties (56 on this profile), including account balance, client IDs, and status. Right: the live event timeline. MB Appointment Booked at 10:51 PM, MB Appointment Cancelled, and Placed Order revenue events with real dollar values, each one a flow trigger and a segment condition.

The data native doesn't have

Forward-looking appointment intelligence. The next scheduled visit lives on the profile: date and time, day, service name, staff member, location, and site. The moment this client books, cancels, reschedules, or attends anywhere in the fleet, these fields recompute automatically. This powers reminder flows, no-show prevention, and "nothing booked" rescue campaigns.

Per-location intelligence on every profile. Home location, last visited, last purchase location, and upcoming appointment location, every value the actual studio name from a managed mapping table. This is how 106 studios delineate inside one Klaviyo account, and multi-location members (your snowbirds) keep a full location trail instead of overwriting each other's data.

Segments and flows, optional and ready to go

These are examples of what the synced data makes possible, shown running in our demo account. SweatHouz already has its own flows and segments, and nothing here replaces them. If the team wants any of it, our provisioner installs it into the Klaviyo account on request (and it is idempotent, so it never creates duplicates). If not, the data simply powers what you have already built.

The segment set (optional). Lifecycle segments (Intro Offer Buyers, No Upcoming Appointment, Lapsed 30 Days, Contract Renewal Window, Waiver Not Signed, promo opt-in) plus per-location segment trios (home location, visited, upcoming appointment at) generated from the studio list. Available on request; member counts shown are from our demo data.

Five example flows. Intro Offer Welcome, Rescue (no upcoming visit), Win-Back at 30 days lapsed, Contract Renewal Window, and Post-Purchase Thank You triggered by the Placed Order revenue event. These show the lifecycle moments the data unlocks; SweatHouz can adopt them, adapt them, or ignore them entirely and keep its own.

What the synced data does inside a send

VMO Media knows Klaviyo, so the point here is not the email craft. The point is the chain underneath it: **a data point we sync** defines a **segment**, the segment (or a revenue event) **triggers a flow**, and the flow's email **personalizes from the same data**. Each example below names the field that makes it possible. Several of them cannot be built on the native data at all, because the field does not exist there.

Rendered from live Klaviyo templates in our demo account under our demo brand. Creative stays entirely with VMO Media.

Intro Offer Welcome. Segment: *intro offer purchased*. Body pulls *home studio*, the *service name*, and the *date, time and staff* of the booking that was just made.

Rescue. Segment: *next scheduled visit* is empty. This one is impossible on native data, because native has no forward-looking field to segment on.

Post-Purchase. Trigger: the Placed Order event. Body pulls the *actual line items, total and studio*, which also makes it a valid HSA/FSA receipt.

THE CHAIN, IN FOUR STEPS

1. DATA POINT

We sync it from Mindbody within seconds: next scheduled visit, last attended visit, home studio, intro offer, contract end date, the sale itself.

2. SEGMENT

The field defines an audience: nobody booked, lapsed 30 days, renewal window open, intro buyer who never converted.

3. TRIGGER

Entering that segment, or an event like Placed Order landing, starts the flow at exactly the right moment.

4. THE SEND

The email personalizes from the same fields: the studio's name, the service booked, the staff member, the items purchased.

The constraint worth noticing: a flow can only be as good as the field underneath it. Rescue exists because a "next scheduled visit" field exists. Remove the field and the campaign has nothing to fire on.

The data layer, in full

Profile properties (69+)

- **Identity and account:** stable cross-site client identity, per-site client IDs, status (full Mindbody vocabulary), account balance refreshed after every sale, liability waiver state, gender, referral source, visit counts.
- **Location intelligence:** home location, every location visited, last location visited, last purchase location, upcoming appointment location. Names come from a managed mapping table, never raw IDs.
- **Appointment intelligence, backward:** last visit date (real attendance, never no-shows), service, type, time, and staff, plus latest appointment status.
- **Appointment intelligence, forward:** next appointment date and time, day, service, category, staff, and location, recomputed within seconds of every booking event.
- **Sales and packages:** last intro offer purchased, package and series balances with expiration dates, purchase context.
- **Membership and contract:** contract name, start and end dates, auto-renewal flag, membership status, kept current for the life of the contract.
- **Consent (optional, off by default):** a per-account switch SweatHouz turns on or leaves off. When on, the Mindbody promotional-email flag (and only that flag) writes real Klaviyo email consent: one-way, subscribe-only, never unsubscribing anyone, and a Klaviyo-side unsubscribe always wins. When off, consent is untouched and the flags sync as plain data. SMS is never auto-subscribed under either setting, which is a deliberate compliance decision rather than a limitation.

Events: 15 custom metrics

EVENT	UNLOCKS
MB Appointment Booked	Confirmations, pre-visit prep
MB Appointment Confirmed	Native-parity confirmation touch
MB Appointment Arrived	Same-day engagement
MB Appointment Completed	Post-visit follow-up
MB Appointment Cancelled	Cancel-save and rebooking flows
MB Intro Session Completed	Intro-to-member conversion, same day
MB Class Booked / Completed / Cancelled	Class journeys (future-proofing; SweatHouz is appointments-only today)
MB Membership Activated	New-member onboarding
MB Membership Cancelled	Exit-save and win-back, same day
MB Contract Created / Cancelled	Renewal journeys, contract save flows
Placed Order (<i>Klaviyo-canonical</i>)	Revenue reporting, predictive CLV and churn, post-purchase flows
Ordered Product (<i>Klaviyo-canonical</i>)	Line-item product journeys

Every event carries site, location, and staff detail plus an idempotent unique ID, so backfills and replays can never double-count. Canonical Placed Order and Ordered Product names mean Klaviyo's own revenue dashboards and predictive analytics work out of the box.

Engineering for 100+ sites in one Klaviyo account

Moving appointment and sales data for a million-contact account across 100+ sites is an infrastructure problem, not just a field-mapping problem. This is the part nobody shows in a demo, and it is where integrations die at scale.

- **Resilient identity.** Mindbody client IDs change (key cards) and the same numeric ID means different people at different sites. We key on Mindbody's stable unique client ID with per-site composite keys, resolve by email fresh on every write, and create missing profiles automatically. Cross-site visitors stay one clean profile with correct counts, revenue, and consent.
- **Site-guarded shared data.** Any value writable by more than one site carries a site marker with sooner-wins rules, so a Boston booking never clobbers a Miami member's still-valid next appointment.
- **Rate-limit and load management.** 106 sites writing into one Klaviyo account through one API key will hit rate limits if handled naively. Fleet-wide pacing, retry with backoff, and parallel per-site processing are built in; one busy studio cannot starve the rest.
- **Self-healing sales sweep.** Every night we re-check the sales window against Mindbody and replay anything a webhook missed. In live validation the sweep healed 4 missed sales, including a multi-item cart, with true sale timestamps.
- **Historical backfill.** Client profiles loaded at onboarding to whatever window is agreed (30 days, 24 months, all time), plus the purchase and visit history replayed as real Klaviyo events, which native does not do. Backfilled records are flagged so they can always be told apart from live activity.
- **Per-site monitoring.** Every site account carries an alert forwarder that reports any automation issue to a central webhook (Slack-ready), on top of APIANT's standard alerting. We usually see a problem before you do.

WHAT ADDING STUDIO #107 LOOKS LIKE

The franchise adds a row to a shared tracking sheet. We create the site account, deploy the integration folder, run the onboarding checklist, verify with a test batch, and turn it on. Per-location segments provision automatically. The other 106 connections are never touched. This is the same process running today for a fitness brand at 235 locations adding several sites per month.

INVESTMENT

Partner pricing for SweatHouz

Pricing is built to be proportionate at this scale. Here is the entire structure, nothing hidden: per location, per month. No contact-volume pricing, no tiers, no surprises, and the rate is locked in writing as the fleet grows.

	LIST PRICE	SWEATHOUZ PARTNER PRICE	SAVINGS
Onboarding, all 106 sites (one time)	\$54,000	\$5,300	\$48,700 (90% off)
Monthly appointment + sales sync , 106 sites	\$10,564/mo	\$5,300/mo	\$5,264/mo (50% off)
Annualized recurring	\$126,768/yr	\$63,600/yr	\$63,168/yr

List monthly is APIANT's published pricing: \$169 base plan (both pipelines) + 105 additional locations at \$99 each (\$49 per location, plus \$25 appointments sync and \$25 sales sync). Partner monthly: \$50 per location, both pipelines included. List onboarding: \$1,500 first site + 105 × \$500. Partner onboarding: flat \$50 per site, first site included.

\$100

FIRST-MONTH COST OF A NEW STUDIO (\$50 ONBOARDING + \$50/MO), PLUS 25,000 CALLS ADDED TO THE POOL

2,650,000

MINDBODY API CALLS PER MONTH INCLUDED, POOLED ACROSS ALL 106 SITES

\$0

EXTRA COST FOR 1M+ CONTACTS. PRICING IS NEVER BASED ON CONTACT VOLUME

Mindbody API allotment

Each site is allotted **25,000 Mindbody API calls per month, pooled across the entire network**: at 106 sites that is **2,650,000 calls a month** shared across the fleet, so a busy studio draws on the quiet ones, and every new location adds another 25,000. Normal operation runs comfortably inside it. Overage is **\$0.0006 per Mindbody API call**, billed only when driven by out-of-scope work: extended history backfills beyond the agreed window, one-off batch processes, or custom integrations. Routine syncing does not generate overage.

What the monthly includes

Dedicated server for the SweatHouz fleet, event-driven appointment sync (booked, rescheduled, completed, cancelled), sales and revenue events, the pooled API allotment above, per-site monitoring, Klaviyo rate-limit and load management, VIP same-day support, and full onboarding execution for every new studio: APIANT does the work, the new site is one row on a shared sheet.

Separately scoped

Axle data migration: a professional-services add-on, scoped after discovery. Full transparency: we have not migrated from Axle specifically, but we have done data migrations for some of the biggest fitness brands over ten years and the mechanics are the same. One flag worth scoping early: pre-payment funnel leads (name, email, phone, consent) sit in Axle upstream of Mindbody, so an Axle export during migration is how those contacts are kept.

Extended-history backfills, one-off batch processes, and custom integrations are quoted separately.

THE PLAN

106 sites live in 4 to 5 weeks

The governing principle: the native integration is not turned off until our sync is verified to deliver everything it provided, plus the new data. Through setup we add data alongside the native sync, into the existing Klaviyo account and its existing fields, so the current setup keeps working while the new one is proven. Where an existing flow or segment does need a change at cutover, it is identified in advance and agreed with the team, not discovered afterwards.

1 Week 1: Discovery and coordination

Kickoff call. Backfill criteria agreed (how far back, which client sets), Mindbody API activation started for the site list (we coordinate directly with the Mindbody success contact), shared tracking sheet established. Marc Floyd is your named onboarding lead, the same person who answers support later.

2 Week 2: Pilot batch

A test batch of sites goes live first. We verify end to end: properties populating, location values correct, per-location segmentation working the way the team plans to build on it. The pilot is signed off before anything scales, and it runs alongside the native integration rather than replacing it.

3 Weeks 2 to 4: Fleet rollout

Each site is cookie-cutter from the pilot pattern: same checklist, same verification, several sites installed per day, historical backfill per the agreed criteria. All 106 sites run in parallel with native.

4 Weeks 4 to 5: Parity verification and cutover

We produce the side-by-side property comparison and confirm our sync covers everything native provided. Then the cutover, strictly in this order: native disabled first, then ours becomes the sole source. That sequencing prevents duplicate revenue events from firing the same flow twice.

5 Ongoing: every new studio

Add a row to the tracking sheet; we run the checklist, test, and turn it on. \$50 once, \$50 a month, other sites untouched.

SUPPORT AND TERMS

- **VIP same-day support**, often by phone when urgent, from the person who onboarded you.
- **AI-assisted tracing**: every data movement is logged per contact. "What happened to this client" is answered with the exact action and root cause.
- **Continuous fleet monitoring**: per-site health, sync freshness, and error rates, watched all day.
- **Annual commitment**, paid monthly or annually (annual prepay earns an additional discount, quoted on the order form).
- **30 days to change your mind after launch**: if it is not the right fit, SweatHouz is released from the contract and APIANT assists with an orderly revert to the previous setup. The integration runs while the subscription is active.
- **Price lock**: \$50/\$50 holds as the fleet grows. No repricing as the fleet passes 150 or 200 locations.

Straight answers

The native integration is free. Why pay anything?

Free covers 106 locations standing still. It does not cover adding studios continuously, it backfills no purchase or visit history, it sends no appointment-cancellation event, and it cannot say when a member is coming in next. \$50 per location buys the data layer that runs retention, and the assurance that nobody on the team has to think about the integration again.

What happens to the flows and segments already built?

They are the priority. Through setup APIANT only adds data alongside the native sync, into the same account and the same fields, and native is switched off only after parity is verified and signed off. Before cutover we audit every flow and segment that touches Mindbody data and produce the list of anything that needs a change, so the work is planned with the team rather than discovered later.

What happens when studio #107 opens?

The new site is added to a shared tracking sheet. APIANT deploys it, tests it, and turns it on. \$50 once, \$50 a month, and the other 106 connections are never touched. The same process runs today for a fitness brand at 235 locations.

What if it does not work out?

Thirty days after launch to change your mind, with no penalty, and APIANT works with the team to revert to the previous setup in an orderly way. And because there is no cutover from native until parity is proven, nothing is at risk before then.

Is \$5,300 a month a lot?

It is \$50 per studio, roughly the price of one intro session per location per month, for the data layer that automates the large majority of conversion and retention. Published list pricing for a fleet this size is \$10,564 a month, and standard onboarding would be \$54,000; the partner price is \$5,300 and \$5,300 (50% and 90% off). The 1M+ contacts cost nothing extra.

Why is this below APIANT's published pricing?

List pricing is built for smaller fleets. At 100+ locations it is discounted to stay proportionate, in exchange for an annual commitment, and the rate is locked in writing as the brand grows.

Who supports this when something breaks?

Same-day VIP support with per-contact tracing. Every data movement is logged, so "what happened to this client" is answered with the exact action and root cause, not a guess. The onboarding lead is also the support contact.

Are there limits on the data we can sync?

Each site is allotted 25,000 Mindbody API calls a month and the allotment is pooled across the whole network (2,650,000 a month at 106 sites), so busy studios draw on quieter ones. Routine syncing runs well inside it. Overage is \$0.0006 per call and applies only to out-of-scope work such as extended history backfills, one-off batch processes, or custom integrations.

Can APIANT handle the Axle migration too?

Yes, as a scoped professional-services add-on. Ten years of fitness-brand data migrations, though this would be the first from Axle specifically. Said plainly rather than oversold, because that is who you want doing a migration.

NEXT STEPS

1. A 30-minute call to confirm the site list and the backfill criteria.
2. APIANT sends the order form at the partner pricing above.
3. Kickoff within a week of signature; pilot sites live the week after.

APIANT Fred Lumiere, fredl@apiant.com, apiant.com
